

# Documentation

Welcome to the Synconix Documentation page !

This documentation covers the basics of Synconix , from script Installation to the full Dashboard usage and backup tips.

[Expand all](#) [Collapse all](#)

Synconix is designed as a Cloud Management Panel for all production servers and storage servers without the need to use multiple management panels. In short you will control your entire backup network from one place.

Based on the working diagram the Synconix management panel is controlling the entire backup network and the storage server can backup all your production servers on a specific storage server or you can create an individual schedules for each storage and this way you will have the backups on multiple storage servers.
